## Optimum Design - Sheet 2 - Solution Graphical Optimization

1. Solve the following problems using the graphical method by hand and a Matlab code:
a. Maximize $f\left(x_{1}, x_{2}\right)=4 x_{1} x_{2}$
subject to $x_{1}+x_{2} \leq 20$

$$
\begin{gathered}
x_{2}-x_{1} \leq 10 \\
x_{1}, x_{2} \geq 0
\end{gathered}
$$

## Solution:

$$
\begin{aligned}
& F=4 x_{1} x_{2} ; \\
& \mathrm{g}_{1}=x_{1}+x_{2}-20 \leq 0 ; \\
& \mathrm{g}_{2}=x_{2}-x_{1}-10 \leq 0 ; \\
& \mathrm{g}_{3}=-x_{1} \leq 0 ; \\
& \mathrm{g}_{4}=-x_{2} \leq 0
\end{aligned}
$$

The optimum solution is: $x_{1}^{*}=10, x_{2}^{*}=10, F^{*}=400$
Active constraint: $g_{1}$.

## Matlab Code

```
%Create a grid from -1 to 7 with an increment of 0.01 for the variables xl and x2
[x1, x2]=meshgrid(-1:0.5:25.0, -1:0.5:25.0);
                                    %Enter functions for the minimization problem

b. Minimize $f\left(x_{1}, x_{2}\right)=5 x_{1}+10 x_{2}$ subject to $10 x_{1}+5 x_{2} \leq 50$
$5 x_{1}-5 x_{2} \geq-20$
$x_{1}, x_{2} \geq 0$

## Solution:

$$
\begin{aligned}
& f=5 x_{1}+10 x_{2} ; \\
& \mathrm{g}_{1}=10 x_{1}+5 x_{2}-50 \leq 0 ; \\
& \mathrm{g}_{2}=-5 x_{1}+5 x_{2}-20 \leq 0 ; \\
& \mathrm{g}_{3}=-x_{1} \leq 0 ; \\
& \mathrm{g}_{4}=-x_{2} \leq 0
\end{aligned}
$$

The optimum solution is: $x_{1}^{*}=0, x_{2}^{*}=0, f^{*}=0$
Active constraints: $\mathrm{g}_{3}$ and $\mathrm{g}_{4}$.

2. Solve the rectangular beam problem of Sheet 2 Problem 4 graphically by hand and a Matlab code for the following data: $M=80 \mathrm{kN} \cdot \mathrm{m}, V=150 \mathrm{kN}, \sigma_{a}=8 \mathrm{MPa}$, and $\tau_{a}=$ 3MPa.

Fig. 1 Cross section of a rectangular beam.

## Solution:

Rewrite the formulation of Problem 2 in sheet 4
$M=80 \mathrm{kN} . \mathrm{m}=8.0 \times 10^{\circ} \mathrm{N} . \mathrm{cm} ; V=150 \mathrm{kN}=1.5 \times 10^{3} \mathrm{~N} ; \sigma_{a}=8 \mathrm{MPa}=800 \mathrm{~N} / \mathrm{cm}^{2} ; \tau_{a}=300 \mathrm{~N} / \mathrm{cm}^{2}$
Using units of Newtons and centimeters, we have: minimize $f=b d$; subject to
$\mathrm{g}_{1}: \frac{6 M}{b d^{2}}-\sigma_{a} \leq 0 ; \quad \mathrm{g}_{1}=\frac{6\left(8.0 \times 10^{6}\right)}{b d^{2}}-800 \leq 0 ;$
$\mathrm{g}_{2}: \frac{3 V}{2 b d}-\tau_{a} \leq 0 ; \mathrm{g}_{2}=\frac{3\left(1.5 \times 10^{5}\right)}{2 b d}-300 \leq 0 ;$
$\mathrm{g}_{3}=d-2 b \leq 0 ;$
$\mathrm{g}_{4}=-b \leq 0$;
$\mathrm{g}_{5}=-d \leq 0$
Optimum solution: $b^{\dagger} \doteq 24.66 \mathrm{~cm}, d^{\dagger} \doteq 49.32 \mathrm{~cm}, f^{\circ} \doteq 1216 \mathrm{~cm}^{2} ; \mathrm{g}_{1}$ (bending stress) and $\mathrm{g}_{3}$ (depth- ratio) constraints are active.

## Matlab Code

```
%Create a grid from -10 to 70 with an increment of 0.1 for the variables xl and x2
[b,d]=meshgrid(-10:0.1:70.0, -10:0.1:70.0);
%Enter functions for the minimization problem
f=b.*d;
gl=(48*10.^6)./(b.* (d.^2))-800;
g2=(2.25*10^5)./(b.*d) -300;
g3=0.5.*d-b;
g4=-b;
g5=-d;
cla reset

hold off %Indicates end of this plotting sequence
    %Subsequent plots will appear in separate windows
```

3. Solve the cantilever beam problem of Sheet 2 Problem 7 graphically by hand and a Matlab code for the following data: $P=10 \mathrm{kN} ; L=5.0 \mathrm{~m}$; modulus of elasticity, $E=$ 210 Gpa ; allowable bending stress, $\sigma_{b}=250 \mathrm{MPa}$; allowable shear stress, $\tau_{a}=90$ MPa; mass density, $\rho=7850 \mathrm{~kg} / \mathrm{m} 3 ; R_{o} \leq 20.0 \mathrm{~cm} ; R_{i} \leq 20.0 \mathrm{~cm}$.

Fig. 2 Cantilever beam.

## Solution:

Using kg, N and cm as units
Given Data: (this data will change if different units are used)
$P=10 \mathrm{kN}=10^{4} \mathrm{~N}$
$L=5 \mathrm{~m}=500 \mathrm{~cm}$
$\sigma_{a}=250 \mathrm{MPa}=2.5 \times 10^{4} \mathrm{~N} / \mathrm{cm}^{2}$;
$\tau_{a}=90 \mathrm{MPa}=9000 \mathrm{~N} / \mathrm{cm}^{2}$
$\rho=7850 \mathrm{~kg} / \mathrm{m}^{3}=7.85 \times 10^{-3} \mathrm{~kg} / \mathrm{cm}^{3}$;
Cross-sectional area of hollow tubes: $A=\pi\left(R_{o}^{2}-R_{i}^{2}\right)$
Moment of inertia of a hollow tube is $I=\pi\left(R_{\circ}^{4}-R_{i}^{4}\right) / 4$
Maximum bending stress:

$$
\sigma=\frac{P L}{I} R_{0}
$$

## Maximum shearing stress:

$$
\tau=\frac{V Q}{I b} ; \quad V=P ; \quad Q=\frac{2}{3}\left(R_{o}^{3}-R_{i}^{3}\right) ; \quad b=2\left(R_{o}-R_{i}\right)
$$

Substituting various quantities and simplifying the expression, we get

$$
\tau=\frac{P}{3 I}\left(R_{o}^{2}+R_{0} R_{i}+R_{i}^{2}\right)
$$

In addition, it must be ensured that $R_{o}>R_{i}$ which can be imposed as a constraint on the wall thickness as $t \geq t_{\min }$ with $t_{\min }$ as, say 0.1 cm .

Thickness: $t=R_{o}-R_{i}$

Referring to Exercise 2.23 and the given data, the problem is formulated in terms of the design variables only as follows:

$$
\begin{aligned}
& f=\left(7.85 \times 10^{-3}\right)(500) \pi\left(R_{0}^{2}-R_{\mathrm{i}}^{2}\right)=12.331\left(\mathrm{R}_{0}^{2}-\mathrm{R}_{\mathrm{i}}^{2}\right) \\
& \mathrm{g}_{1}=\frac{4 P l R_{o}}{\pi\left(R_{\circ}^{4}-R_{\mathrm{i}}^{4}\right)} \leq \sigma_{a} ; \text { or } \\
& \mathrm{g}_{1}=\frac{R_{o}\left(4.0 \times 10^{4}\right)(500)}{\pi\left(R_{o}^{4}-R_{\mathrm{i}}^{4}\right)} \leq\left(2.5 \times 10^{4}\right) ; \text { or } \\
& \mathrm{g}_{1}=\frac{R_{0} 6.3662 \times 10^{6}}{\left(R_{0}^{4}-R_{\mathrm{i}}^{4}\right)}-2.5 \times 10^{4} \leq 0
\end{aligned}
$$

$\mathrm{g}_{2}=\frac{4 P\left(R_{\mathrm{o}}^{2}+R_{\mathrm{o}} R_{\mathrm{i}}+R_{\mathrm{i}}^{2}\right)}{3 \pi\left(R_{\mathrm{o}}^{4}-R_{\mathrm{i}}^{4}\right)} \leq \tau_{a}$; or
$\mathrm{g}_{2}=\frac{\left(4.0 \times 10^{4}\right)\left(R_{\mathrm{\circ}}^{2}+R_{\mathrm{o}} R_{\mathrm{i}}+R_{\mathrm{i}}^{2}\right)}{3 \pi\left(R_{\mathrm{o}}^{4}-R_{\mathrm{i}}^{4}\right)} \leq 9000$; or
$\mathrm{g}_{2}=\frac{4244.13\left(R_{\mathrm{o}}^{2}+R_{\mathrm{o}} R_{\mathrm{i}}+R_{\mathrm{i}}^{2}\right)}{\left(R_{\mathrm{o}}^{4}-R_{\mathrm{i}}^{4}\right)}-9000 \leq 0 ;$
$\mathrm{g}_{3}=R_{\mathrm{o}}-20 \leq 0 ;$
$\mathrm{g}_{4}=R_{\mathrm{i}}-20 \leq 0 ;$
$\mathrm{g}_{5}=-R_{\mathrm{o}} \leq 0$;
$\mathrm{g}_{6}=-R_{\mathrm{i}} \leq 0$

## FORMULATION 2: Using Intermediate Variables

Step 4: Optimization Criterion
Optimization criterion is to minimize mass of hollow tube, and the cost function is defined as $f=\rho A L$

Step 5: Formulation of Constraints
$\mathrm{g}_{1}$ : bending stress should be smaller than the allowable bending stress; $\sigma \leq \sigma_{a}$
$g_{1}=\sigma-\sigma_{a} \leq 0$
$\mathrm{g}_{2}$ : shear stress smaller than allowable shear stress: $\tau \leq \tau_{a}$
$g_{2}=\tau-\tau_{a} \leq 0$
$\mathrm{g}_{3}=R_{\circ}-20 \leq 0$
$\mathrm{g}_{4}=R_{\mathrm{i}}-20 \leq 0$
$\mathrm{g}_{5}=-R_{0} \leq 0$
$\mathrm{g}_{6}=-R_{\mathrm{i}} \leq 0$
$g_{7}=t_{\text {min }}-t \leq 0$

Optimum solution: $R_{\mathrm{o}}^{*}=20 \mathrm{~cm}, R_{\mathrm{i}}^{*}=19.84 \mathrm{~cm}, f^{*} \doteq 79.1 \mathrm{~kg}, \mathrm{~g}_{1}$ (bending stress) and $\mathrm{g}_{3}$ (max. outer radius) constraints are active.
