## Lecture 2

# Overview of the CFD

February 2, 2016

# Overview of the CFD Process

# Introduction

## Lecture Theme:

All CFD simulations follow the same key stages. This lecture will explain how to go from the original planning stage to analyzing the end results

## Learning Aims:

You will learn:

- The basics of what CFD is and how it works
- The different steps involved in a successful CFD project

## Learning Objectives:

When you begin your own CFD project, you will know what each of the steps requires and be able to plan accordingly

# What is CFD?

**Computational Fluid Dynamics (CFD) is the science of predicting fluid flow, heat and mass transfer, chemical reactions, and related phenomena.**

**To predict these phenomena, CFD solves equations for conservation of mass, momentum, energy etc..**

**CFD can provide detailed information on the fluid flow behavior:**

- Distribution of pressure, velocity, temperature, etc.
- Forces like Lift, Drag.. (external flows, Aero, Auto..)
- Distribution of multiple phases (gas-liquid, gas-solid..)
- Species composition (reactions, combustion, pollutants..)
- Much more

**CFD is used in all stages of the engineering process:**

- Conceptual studies of new designs
- Detailed product development
- Optimization
- Troubleshooting
- Redesign

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

**CFD analysis complements testing and experimentation by reducing total effort and cost required for experimentation and data acquisition**

# How Does CFD Work?

## ANSYS CFD solvers are based on the finite volume method

- Domain is discretized into a finite set of control volumes
- General conservation (transport) equations for mass, momentum, energy, species, etc. are solved on this set of control volumes

$$\underbrace{\frac{\partial}{\partial t} \int_V \rho \phi dV}_{\text{Unsteady}} + \underbrace{\oint_A \rho \phi \mathbf{V} \cdot d\mathbf{A}}_{\text{Convection}} = \underbrace{\oint_A \Gamma_\phi \nabla \phi \cdot d\mathbf{A}}_{\text{Diffusion}} + \underbrace{\int_V S_\phi dV}_{\text{Generation}}$$

Equation	$\phi$
Continuity	1
X momentum	$u$
Y momentum	$v$
Z momentum	$w$
Energy	$h$

- Partial differential equations are discretized into a system of algebraic equations
- All algebraic equations are then solved numerically to render the solution field

Summary

# Step 1. Define Your Modeling Goals

- **What results are you looking for (i.e. pressure drop, mass flow rate), and how will they be used?**
- **What are your modeling options?**
  - What simplifying assumptions **can you make** (i.e. symmetry, periodicity)?
  - What simplifying assumptions do you **have to make**?
  - What physical models will need to be included in your analysis
- **What degree of accuracy is required?**
- **How quickly do you need the results?**
- **Is CFD an appropriate tool?**

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

## Step 2. Identify the Domain You Will Model

- **How will you isolate a piece of the complete physical system?**
- **Where will the computational domain begin and end?**
  - Do you have boundary condition information at these boundaries?
  - Can the boundary condition types accommodate that information?
  - Can you extend the domain to a point where reasonable data exists?
- **Can it be simplified or approximated as a 2D or axi-symmetric problem?**

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

## Step 3. Create a Solid Model of the Domain

- **How will you obtain a model of the *fluid* region?**
  - Make use of existing CAD models?
  - Extract the fluid region from a solid part?
  - Create from scratch?
- **Can you simplify the geometry?**
  - Remove unnecessary features that would complicate meshing ;fillets, bolts...?
  - Make use of symmetry or periodicity?
    - Are both the flow and boundary conditions symmetric / periodic?
- **Do you need to split the model so that boundary conditions or domains can be created?**

Original CAD Part

Extracted Fluid Region

Solution

Post-Processing

Summary

# Step 4. Design and Create the Mesh

- **What degree of mesh resolution is required in each region of the domain?**
  - Can you predict regions of high gradients?
    - The mesh must resolve geometric features of interest and capture gradients of concern, e.g. velocity, pressure, temperature gradients
  - Will you use adaption to add resolution?
- **What type of mesh is most appropriate?**
  - How complex is the geometry?
  - Can you use a quad/hex mesh or is a tri/tet or hybrid mesh suitable?
  - Are non-conformal interfaces needed?
- **Do you have sufficient computer resources?**
  - How many cells/nodes are required?
  - How many physical models will be used?

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

# Step 5. Set Up the Solver

- **For a given problem, you will need to:**
  - Define material properties
    - Fluid
    - Solid
    - Mixture
  - Select appropriate physical models
    - Turbulence, combustion, multiphase, etc.
  - Prescribe operating conditions
  - Prescribe boundary conditions at all boundary zones
  - Provide initial values or a previous solution
  - Set up solver controls
  - Set up convergence monitors

*For complex problems solving a simplified or 2D problem will provide valuable experience with the models and solver settings for your problem in a short amount of time*

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

## Step 6. Compute the Solution

- The discretized conservation equations are solved iteratively until convergence
- Convergence is reached when:
  - Changes in solution variables from one iteration to the next are negligible
    - Residuals provide a mechanism to help monitor this trend
  - Overall property conservation is achieved
- Imbalances measure global conservation
  - Quantities of interest (e.g. drag, pressure drop) have reached steady values
- Monitor points track quantities of interest
- The accuracy of a **converged** solution is dependent upon:
  - Appropriateness and accuracy of physical models
  - Assumptions made
  - Mesh resolution and independence
  - Numerical errors

*A converged and mesh-independent solution on a well-posed problem will provide useful engineering results!*

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

# Step 7. Examine the Results

- **Examine the results to review solution and extract useful data**

- Visualization Tools can be used to answer such questions as:

- What is the overall flow pattern?
- Is there separation?
- Where do shocks, shear layers, etc. form?
- Are key flow features being resolved?

- Numerical Reporting Tools can be used to calculate quantitative results:

- Forces and Moments
- Average heat transfer coefficients
- Surface and Volume integrated quantities
- Flux Balances

Examine results to ensure correct physical behavior and conservation of mass energy and other conserved quantities. High residuals may be caused by just a few poor quality cells.

Introduction

CFD Approach

Pre-Processing

Solution

Post-Processing

Summary

# Step 8. Consider Revisions to the Model

- **Are the physical models appropriate?**
  - Is the flow turbulent?
  - Is the flow unsteady?
  - Are there compressibility effects?
  - Are there 3D effects?
- **Are the boundary conditions correct?**
  - Is the computational domain large enough?
  - Are boundary conditions appropriate?
  - Are boundary values reasonable?
- **Is the mesh adequate?**
  - Does the solution change significantly with a refined mesh, or is the solution mesh independent?
  - Does the mesh resolution of the geometry need to be improved?
  - Does the model contain poor quality cells?

*High residuals may be caused by just a few poor quality cells*

Introduction

CFD Approach

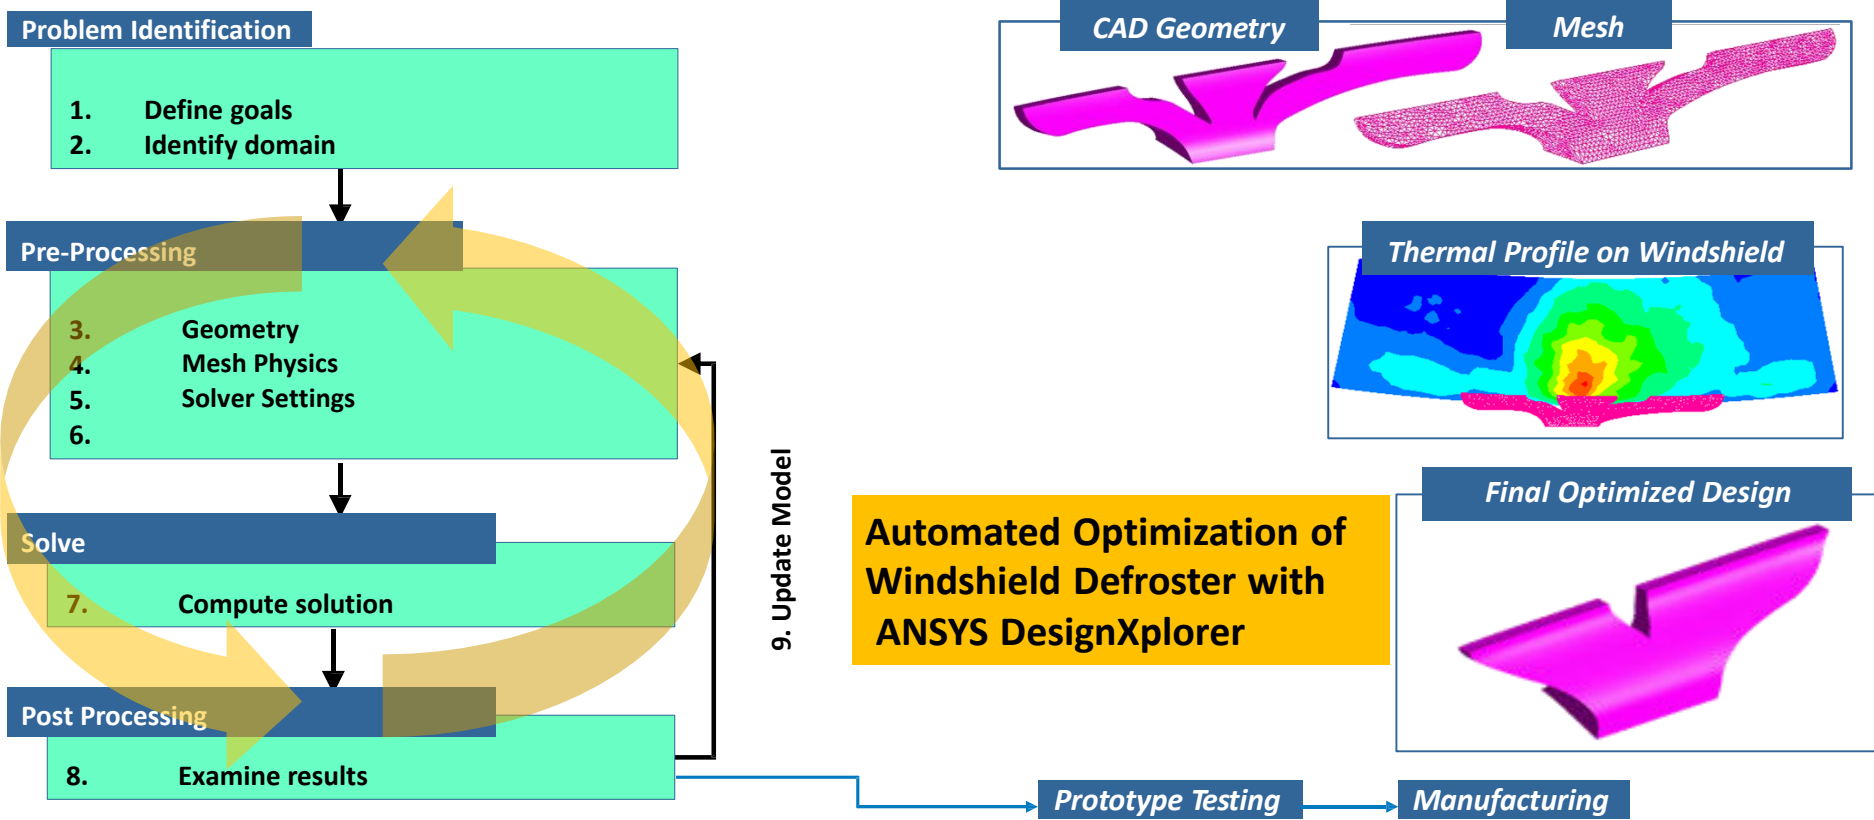

Pre-Processing

Solution

Post-Processing

Summary

# Use CFD with Other Tools to Maximize its Effect

# Summary and Conclusions

- **Summary:**

- All CFD simulations (in all mainstream CFD software products) are approached using the steps just described
- Remember to first think about what the aims of the simulation are prior to creating the geometry and mesh
- Make sure the appropriate physical models are applied in the solver, and that the simulation is fully converged (more in a later lecture)
- Scrutinize the results, you may need to rework some of the earlier steps in light of the flow field obtained

- 1. Define Your Modeling Goals**
2. Identify the Domain You Will Model
- 3. Create a Geometric Model of the Domain**
4. Design and Create the Mesh
- 5. Set Up the Solver Settings**
6. Compute the Solution
- 7. Examine the Results**
8. Consider Revisions to the Model
